

Comprehensive Restructuring and Annual Revision of the U.S. International Transactions Accounts

By Jeffrey R. Bogen, Mai-Chi Hoang, Kristy L. Howell, and Erin M. Whitaker

IN JUNE 2014, the Bureau of Economic Analysis (BEA) released annual revisions of the U.S. international transactions accounts (ITAs) and the U.S. international investment position (IIP) accounts. Through annual revisions, BEA introduces new classifications and definitions, newly available and revised source data, and new and improved methodologies. Together, these changes improve the accuracy and the consistency of the statistics and address important new developments in the U.S. economy and in international economies. In this annual revision, statistics on U.S. international transactions for the first quarter of 1999 to the fourth quarter of 2013 were revised to incorporate newly available and revised source data, updated seasonal adjustments, improved estimation methodologies, and changes in classifications and definitions.

With this annual revision, BEA also introduces a new presentation of the ITAs as part of a comprehensive restructuring of BEA's international economic accounts.¹ This restructuring represents the most significant change to the international accounts since 1976. It is part of a multiyear effort to modernize the accounts by introducing changes that bring BEA's statistics into closer alignment with new international statistical guidelines for compiling balance of payments and IIP statistics, including the International Monetary Fund's *Balance of Payments and International Investment Position Manual*, 6th edition.² This change in presentation, combined with changes in classifications and definitions, enhances the quality and usefulness of the accounts for customers. With the release of the restructured ITAs and IIP accounts, BEA has also published the *U.S. International Economic*

Accounts: Concepts and Methods, a new methodology guide for the estimation of the U.S. international economic accounts.

Table A in this article provides a descriptive summary of the major changes to the ITAs.³ Appendix A provides a numerical summary of the revisions in tabular form; for a comparison of these revisions with past annual revisions, see the box "2014 Annual Revision in Historical Context" on page 5. Revised statistics on the detailed components of the ITAs are presented in "U.S. International Transactions Tables" that accompanies this article.

Key changes in classifications, definitions, and presentations include the following:

- The balance of payments sign convention that used negative signs for debit entries has been eliminated. Positive signs are now used to show exports and imports, income receipts and payments, transfers made and received, and acquisitions of assets and incurrences of liabilities. Negative signs specify negative income (losses) and net sales of assets or net repayment of liabilities.
- The use of gross recording—primarily of statistics on secondary income (current transfers), capital-account transactions, and direct investment income and financial flows—has been expanded. The underlying flows are now shown at their full credit or debit values.
- Goods transactions are newly categorized into three major aggregates—general merchandise, net exports of goods under merchanting (exports only), and nonmonetary gold—and end-use commodity detail has been expanded. The number of major categories used to classify services transactions has been expanded from seven to nine. Changes associated with the increase in the number of major categories include separating subcategories out as major categories, consolidating categories, reallocating transactions between categories, and renaming categories.

1. The June release of the IIP accounts also reflects changes in the presentation of the accounts that are consistent with related ITA tables. For more information, see Elena L. Nguyen, "The U.S. Net International Investment Position at the End of the First Quarter of 2014, Year 2013, and Annual Revisions" in this issue.

2. *Balance of Payments and International Investment Position Manual*, 6th ed. (Washington, DC: International Monetary Fund, 2009).

Christopher A. Gohrband, Alexis N. Grimm, and Daniel R. Yorgason also made significant contributions to this article.

3. For more information, see Maria Borga and Kristy L. Howell, "The Comprehensive Restructuring of the International Economic Accounts: Changes in Definitions, Classifications, and Presentations," *SURVEY OF CURRENT BUSINESS* 94 (March 2014).

**Table A. Summary of Major Changes in Classifications, Definitions,
and Presentations to the International Transactions Accounts**

Components	Major changes
Multiple accounts	
Balance of payments signs	Eliminate the balance of payments sign convention that used negative signs for debit entries. Positive signs are now used to show exports and imports, income receipts and payments, transfers made and received, and acquisitions of assets and incurrences of liabilities. Negative signs specify negative income (losses) and net sales of assets or net repayment of liabilities.
Direct investment income and financial transactions	Feature a presentation of these accounts on a gross (asset/liability) basis rather than on a directional basis.
Current account	
Trade in goods	<p>Categorize into three major aggregates: general merchandise, net exports of goods under merchanting (exports only), and nonmonetary gold.</p> <p>Expand the publication of end-use categories for general merchandise trade from 59 categories to 77 categories for exports and from 56 categories to 69 categories for imports.</p> <p>Reclassify net exports of goods under merchanting from services.</p> <p>Provide quarterly seasonally adjusted statistics on trade in goods for selected major trading partner countries and areas in ITA table 2.2.</p>
Trade in services	<p>Classify services by nine new broad categories: maintenance and repair services n.i.e. (not included elsewhere); transport; travel (for all purposes including education); insurance services; financial services; charges for the use of intellectual property n.i.e.; telecommunications, computer, and information services; other business services; and government goods and services n.i.e.</p> <p>Include all services categories in the table that presents trade in services (ITA table 3.1). The previous standard trade in services table (ITA table 3a) excluded transactions by the U.S. military and other government agencies.</p> <p>Show maintenance and repair services n.i.e., insurance services, financial services, and telecommunications, computer, and information services separately. Previously, these services were components of other private services.</p> <p>Classify the remaining components of other private services—research and development services, professional and management consulting services, and technical, trade-related, and other business services—into other business services.</p> <p>Provide quarterly seasonally adjusted statistics on trade in services for selected major trading partner countries and areas in ITA table 3.2.</p> <p>Reclassify net exports of goods under merchanting to goods. Previously, these transactions were included in other private services.</p> <p>Classify transfers under U.S. military agency sales contracts (for exports), direct defense expenditures (for imports), and U.S. government miscellaneous services (for exports and imports) into government goods and services n.i.e. Previously, these components were shown separately.</p>
Travel services	<p>Broaden the definition of travel to include health- and education-related travel and expenditures by short-term workers (previously components of other private services) along with other personal and business travel.</p> <p>Show business and personal travel separately.</p>
Transport services	<p>Replace the previous category “other transportation” services.</p> <p>Include passenger fares, which is shown separately as air passenger transport services in ITA table 3.1. Previously, passenger fares was shown as one of the broad services categories.</p>
Insurance services	Provide quarterly detail on primary insurance, reinsurance, and auxiliary insurance.
Financial services	Provide quarterly detail on securities brokerage, underwriting, and related services; financial management, financial advisory, and custody services; credit card and other credit-related services; and securities lending, electronic fund transfers, and other services.
Charges for the use of intellectual property (previously royalties and license fees)	Provide quarterly detail on the charges for the use of computer software, trademarks and franchise fees, audio-visual and related products, and “other” intellectual property.
Primary income (previously income)	<p>Classify primary investment income into four functional categories: direct investment, portfolio investment, other investment, and reserve assets (receipts only).</p> <p>Provide detail for investment income on equity and investment fund shares, interest income, and income attributable to insurance policyholders.</p> <p>Provide detail for investment income by maturity and by sector.</p>
Secondary income (previously unilateral current transfers)	<p>Record on a gross basis rather than netting transfer receipts and payments.</p> <p>Provide additional detail by type of transfer.</p>
Capital account	
Capital account	Present on a gross basis rather than netting capital-account receipts and payments.
Financial account	
Financial transactions	<p>Rename “U.S.-owned assets abroad, excluding financial derivatives” as “net U.S. acquisition of financial assets excluding financial derivatives” and “foreign-owned assets in the United States, excluding financial derivatives” as “net U.S. incurrence of liabilities excluding financial derivatives.”</p> <p>Rename “net financial flows” as “net lending or net borrowing” (the difference between the net acquisition of assets and the net incurrence of liabilities). Net lending or net borrowing takes the opposite sign of net financial flows.</p> <p>Classify financial transactions into five functional categories: direct investment, portfolio investment, other investment, reserve assets (assets only), and financial derivatives.</p>
Portfolio investment	Provide detail by instrument, by maturity, and by sector.
Other investment	Provide detail by instrument, by maturity, and by sector.
Reserve assets	Provide detail on currency and deposits, securities, financial derivatives, and other claims.

- Financial transactions are classified into five functional categories: direct investment, portfolio investment, other investment, reserve assets (assets only), and financial derivatives. Similarly, transactions in primary investment income are classified into four functional categories: direct investment, portfolio investment, other investment, and reserve assets (receipts only). These functional categories reflect the motivation behind the investment and the relationship between the parties to the transactions.
- Direct investment transactions are now presented on a gross basis according to whether the transactions are related to assets or liabilities. Similarly, direct investment income is now presented on a gross basis according to whether the income is derived from assets or liabilities. In the previous presentation, direct investment and direct investment income were presented on a directional basis—outward or inward—according to whether the investor was a domestic resident or a foreign resident.⁴

Major changes in methodology and source data and other sources of revisions include the following:

- Goods exports and imports for 2009–2013 were revised to reflect revised source data on goods exports and imports from the U.S. Census Bureau and on balance of payments adjustments.
- Services exports and imports for 2011–2013 and services exports for 2006–2008 were revised to reflect newly available and revised data from BEA's quarterly surveys of international services transactions and other sources.
- Travel services exports and imports for 1999–2013 were revised to reflect the implementation of an improved methodology for estimating average expenditures by travelers.
- Travel services imports and air passenger transport imports (previously passenger fare imports) for 1999–2013 were revised to reflect improved source data from the U.S. Department of Homeland Security on the number of U.S. travelers abroad. The revisions to travel services imports for 1999–2013 also reflect an improved methodology for allocating the number of travelers to destination countries.
- Secondary income (current transfer) receipts for 1999–2013 were revised to incorporate source data on receipts from foreign residents for contributions to military operations.
- Financial transactions and primary income related to direct investment for 2011–2013 were revised to incorporate newly available and revised data from BEA's quarterly and annual direct investment surveys.
- Financial transactions and primary income related to portfolio investment for 2011–2013 were revised to incorporate newly available and revised data from the U.S. Department of the Treasury.
- Financial transactions and primary income related to other investment for 2009–2013 were revised to incorporate revisions from several sources.
 - Revisions for 2011–2013 incorporate newly available and revised data from the Department of the Treasury.
 - Revisions for 2011–2013 also incorporate newly available and revised data on transactions of U.S. financial intermediaries with foreign financial intermediaries from BEA's quarterly and annual direct investment surveys that are reclassified from direct investment to other investment.
 - Revisions for 2009–2013 incorporate newly available and revised U.S. government administrative data.
- Financial transactions in financial derivatives for 2013 were revised to incorporate newly available and revised data from the Department of the Treasury.

Generally, this annual revision has not significantly altered the overall picture of recent U.S. international transactions, but certain revisions were notable. The revisions resulted in higher estimates of the current-account deficit for most years (table B). The largest revisions were upward revisions of \$21.0 billion for 2013 and of \$20.3 billion for 2012. The upward revision for 2012 reversed a narrowing of the current-account deficit in the previously published statistics to a slight widening of the deficit (chart 1). The revisions to the current-account balance before 2012 mostly reflect improvements to the methodology for estimating travel services exports and imports and revised source data on air passenger transport imports (previously passenger fare imports). Net borrowing from financial-account transactions (previously net financial flows, with the sign reversed) was revised downward \$35.9 billion for 2010 and \$15.9 billion for 2011 and was revised upward \$19.4 billion for 2013. Although the revisions to the financial flows for 2010–2013 were relatively large, the revised statistics did not change the direction of changes in net borrowing for the revised years (chart 2).

The combined revisions resulted in two notable revisions to the statistical discrepancy—the difference between total debits and total credits recorded in the

4. The directional basis of direct investment income is still available in ITA table 4.2, and the directional basis of direct investment is still available in ITA table 6.1. Tables 4.2 and 6.1 also show the conversion from the gross (asset/liability) basis to the directional basis, which is still used for the country and area statistics in ITA table 1.3.

current, capital, and financial accounts. For 2011, the discrepancy was revised from the previously published $-\$92.8$ billion to $-\$55.2$ billion. For 2012, it was revised from the previously published $-\$5.9$ billion to $\$30.4$ billion.

The remainder of this article discusses all the changes—newly available and revised source data and changes in methodology, in source data, in classifications, in definitions, and in presentations—and the revisions resulting from these changes for the current

account, the capital account, the financial account, and the statistical discrepancy. The revisions due to

newly available and revised source data and to changes in methodology and source data are discussed first to

2014 Annual Revision in Historical Context

The 2014 annual revision represents the first annual revision of statistics for 2013, the second annual revision of statistics for 2012, and the third annual revision of statistics for 2011. Revisions to both the annual and quarterly statistics are generally smaller than the typical first, second, and third annual revisions that were released in 2000–2013 (for statistics covering 1999 to 2012). For the current-account balance, the absolute value of the revision of the annual level for 2012 is larger than the comparable mean absolute revision for the second annual revisions of annual statistics, but as shown in table I, all the other absolute revisions of annual statistics and all the mean absolute revisions (MARs) of quarterly statistics are smaller than their comparable MARs. (In this table, a “ratio” value greater than one indicates that the annual revisions for 2014 are larger than average annual revisions in past years.) For net lending or net borrowing from the financial account, all 2014 absolute revisions (annual statistics) and MARs (quarterly statistics) for 2011–2013 are smaller than the comparable MARs from previous annual revisions.

MARs ratios calculated from statistics reported under the previous ITA presentation are shown in the first two

columns of table II for some of the main component accounts. Among these accounts, only revisions of statistics for the balance on secondary income (previously unilateral current transfers, net) and for the balance on primary income (previously balance on income) are larger than average. In part, these smaller-than-average revisions are attributable to the fact that revisions calculated from the previous ITA presentation excluded changes in classifications and definitions. MARs calculated from statistics under the new presentation are shown in the last two columns of table II. The MARs calculated with the new presentation’s statistics tend to be larger because, for the most part, the changes in classifications and definitions introduced as part of the restructuring tend to increase the value of aggregates as certain transactions previously recorded on a net basis are recorded on a gross basis in the new presentation. However, several balances and their associated revisions—including the current-account balance and net lending or net borrowing from the financial account—are unaffected by the increased gross recording of transactions.

II. Ratios of the Revisions From the 2014 Annual Revision to Revisions From the Previous Annual Revisions

[Geometric mean of ratios of MARs]¹

I. Comparison of Revisions From the 2014 Annual Revision With Revisions From Previous Annual Revisions

	MARs from the 2014 annual revision	MARs from previous annual revisions	Ratio ¹

MARs Mean absolute revisions

1. Ratios are MARs from the 2014 annual revision divided by MARs from previous annual revisions.

2. Revisions to statistics on transactions for 2011 are compared with previous third annual revisions for 2002–2013.

3. Revisions to statistics on transactions for 2012 are compared with previous second annual revisions for 2001–2013.

4. Revisions to statistics on transactions for 2013 are compared with previous first annual revisions for 2000–2013.

NOTE. All revisions are computed as a percentage of trend current-dollar gross domestic product.

MARs Mean absolute revisions

1. Mean computed over three ratios: (1) ratio of MAR of statistics for 2013 to MARs from other first annual revisions; (2) ratio of MAR of statistics for 2012 to MARs from other second annual revisions; (3) ratio of MAR of statistics for 2011 to MARs from other third annual revisions

NOTE. Revisions used in top panel are scaled by item values; revisions used in bottom panel are scaled by trend current-dollar gross domestic product.

distinguish these revisions from the revisions due to changes in classifications, definitions, and presentations. Revisions due to newly available and revised source data and to changes in methodology and source data are discussed based on the previous standard presentation to allow for an easier comparison to the previously published statistics. Next, revisions due to changes in classifications, definitions, and presentations are discussed based on the structure of the new presentation.⁵

Current Account

Revisions due to newly available and revised source data and to changes in methodology and source data

Improved estimation methodology for travel and improved source data for travel and passenger fares. Beginning with statistics for 1999, BEA has implemented

5. With the June release of the ITAs, BEA published statistics through the first quarter of 2014 under both the new standard presentation and the previous standard presentation so that users have a statistical overlap period, or bridge, that allows them to evaluate the relationships between the new series and the old series. The previous presentation is available on the BEA Web site under “International.” Under “Balance of Payments (International Transactions),” click on “Interactive Tables: Detailed estimates” and see tables 1–12 under “Previous standard tables.” Statistics in the previous presentation will not be updated in future releases of the ITAs.

A [concordance table](#) that shows the accounts in table 1 of the previous presentation and those shown in table 1.2 of the new presentation is also available on the BEA Web site.

an improved methodology for estimating travel services exports and imports. The improved methodology is the outcome of an extensive review of the methodology and data sources for compiling travel statistics for transactions with countries other than Canada and Mexico.⁶ During the review process, BEA considered several alternative approaches to estimate cross-border travel transactions, such as using a survey of credit, debit, and charge card issuers alongside a one-time survey of international travelers that measured travelers’ propensities for using different payment methods. After a thorough evaluation of the alternatives, BEA chose to continue the previous general methodology of multiplying the number of travelers by an estimate of average travel expenditures. Key data sources have not changed. However, the use of the data has been refined, and new supplemental source data have been introduced. Average expenditures continue to be based on information from the Survey of International Air Travelers (SIAT) administered by the International Trade Administration of the U.S. Department of Commerce. Under the new methodology, the SIAT information is used to establish baseline estimates of average travel expenditures, which are supplemented with information from (1) a survey of credit, debit,

6. Estimates for travel to and from Canada and Mexico continue to be based on data provided by Statistics Canada and the Bank of Mexico, respectively.

Acknowledgments

Paul W. Farello, Chief of the Balance of Payments Division, supervised the preparation of this year’s annual revision of the international transactions accounts. Kristy L. Howell, Assistant Division Chief for Goods and Services Trade, and Christopher A. Gohrband, Chief of the Financial Accounts Branch, directed major parts of the revision. Maria Borga, former Assistant Division Chief for Research and Analysis, provided general guidance. Sarahelen Thompson, Associate Director for International Economics, provided overall supervision.

The following BEA staff made significant contributions to the revision.

Trade in goods: Marc Bouchard, Mai-Chi Hoang, Benjamin P. Kavanaugh, Fritz Mayhew, and Christian Thieme.

Trade in services and secondary income (current transfers): Michael A. Mann, Damon C. Battaglia, Jeffrey R. Bogen, Laura L. Brokenbaugh, Lori K. Chang, Edward F. Dozier, Anne Flatness, C. Omar Kebbeh, Patricia A. Mosley, Charu Sharma, John A. Sondheimer, Gregory A. Tenentes, and Rodney D. Thorn.

Seasonal adjustment by geography: Ryan Howley, Benjamin P. Kavanaugh, and Christian Thieme.

International services surveys: Mark Xu, Suhail Ally,

Felix Anderson, Stacey L. Ansell, Faith Brannam, Jamela Des Vignes, Hope Jones, Eddie Lee Key, Kiesha V. Middleton, Steven J. Muno, Mark P. Samuel, and Carl C. Tillman.

Financial account and income: Christopher A. Gohrband, Barbara H. Berman, Eric A. Bryda, Dena A. Holland, Elena L. Nguyen, Kyle L. Westmoreland, Erin M. Whitaker, and Cavan J. Wilk.

Methodology and special studies: Daniel R. Yorgason, Thomas Anderson, Alexis N. Grimm, Ryan Howley, Sarah P. Scott, and Douglas Weinberg.

Research: Raymond J. Mataloni and Marilyn Ibarra-Caton.

Direct investment: See “Acknowledgments” in “Direct Investment Positions for 2013” in this issue.

Computer systems and operations: Diane Young, Paula Brown, Marie Colosimo, Karen Poffel, Dan Powell, and Kevin Smith.

Reengineering of systems for statistical production and data dissemination: Benjamin P. Kavanaugh, Douglas Weinberg, Marina Melnik, Gentian Cala, Steve Holliday, Walter Kampas, Paul Kilday, Anna Libkhen, Kenneth Pond, and Shirley Zhou.

Secretarial and program assistance: Pamela N. Aiken and Sheila L. Johnson.

and charge card issuers administered by BEA, (2) other sources of information on traveler expenditures, including studies commissioned by BEA, and (3) bilateral comparisons of source data. The baseline estimates are adjusted to account for particular limitations often faced by expenditure surveys, including underreported spending.

BEA continues to use data on the number of travelers that is collected by the U.S. Department of Homeland Security (DHS) to estimate travel and passenger fares. However, BEA has introduced two significant improvements to the use of these data. First, BEA has fully incorporated the number of outbound U.S. travelers that the DHS began collecting under an improved electronic method in July 2010. The change in collection methods revealed that, for some countries, the estimated number of travelers gathered under the earlier collection method was significantly higher than the number of travelers collected electronically under the new method.⁷ To correct this overestimation and to avoid a break in series between July 2010 and the prior periods, BEA has revised downward the number of outbound travelers used in both the travel and passenger fare imports statistics back to January 1999. Second, BEA has developed an improved method for allocating outbound U.S. travelers to individual countries for its travel imports statistics. This method is based on the relationships observed in the SIAT data between the U.S. traveler's initial country of disembarkation outside of the United States and the ultimate country or countries of destination.

The effect of the changes on the methodology varies by country and by year, but in general, the revised travel statistics follow the same trends as the previously published statistics. Travel exports were revised upward for 1999 and for 2010–2012 and were revised downward for all other years as a result of the new travel methodology. Travel imports were revised downward for 1999–2003 and were revised upward for all other years as a result of (1) the new methodology and (2) the transition to the electronic collection and the accompanying downward revisions to the earlier estimates. The downward revision to the number of travelers also resulted in downward revisions to passenger fare imports for 1999–2013.

Source data on receipts from foreign residents for contributions to military operations from the Department of the Treasury. Beginning with statistics for 1999, BEA has incorporated source data on inflows (receipts) from foreign residents for contributions to

military operations from the Department of the Treasury. These data reflect cash contributions that the host nation provides to the United States to support U.S. troops in the host nation. Contributions include compensation for foreign nationals employed by the U.S. Department of Defense (DOD), military construction projects of the DOD, supplies and services of the DOD, and contributions in support of the relocation of U.S. forces to or from any location in the host nation. As a result of including these inflows, net outflows (payments) of unilateral current transfers for 1999–2013 were revised downward.

Effects of the revisions

Goods. Exports and imports of goods for 2009–2013 were revised (table C). The largest revisions were to goods exports for 2011 and 2013, mostly as a result of revised DOD source data on exports of goods under the Foreign Military Sales program; the revisions also reflect revised source data from the U.S. Census Bureau.

Services. Exports and imports of services for 1999–2013 were revised. Services exports were revised downward for 2000–2009 and were revised upward for all other years. Revisions for all years reflect revisions to travel. The upward revision for 2011 reflects upward revisions to travel and to royalties and license fees. The upward revision for 2012 reflects upward revisions to royalties and license fees, to other transportation, and to travel that were mostly offset by a downward revision to other private services. The upward revision for 2013 reflects an upward revision to other private services that was mostly offset by a downward revision to travel.

Services imports were revised downward for 1999–2004, 2009, and 2010 and were revised upward for all other years. The revisions for 1999–2010 were entirely attributable to revisions to travel and to passenger fares that resulted from the incorporation of both the improved methodology for estimating the average expenditures of travelers and improved data on the number of U.S. travelers abroad. The upward revision for 2011 reflects upward revisions to travel and to royalties and license fees that were mostly offset by a downward revision to passenger fares. The upward revisions for 2012 and 2013 primarily reflect upward revisions to travel that were partly offset by downward revisions to passenger fares. For 2004–2013, upward revisions to travel were partly or entirely offset by downward revisions to passenger fares.

Income. Income receipts and payments for 2011–2013 were revised as a result of newly available and revised source data. Income receipts for all 3 years

7. For more information on the change in data collection, see Office of Travel and Tourism Industries, "U.S. International Outbound Air Travel for 2010" (September 27, 2011).

were revised downward. The downward revision for investment income receipts. The downward revisions for 2011 was due to a downward revision to direct in- 2012 and 2013 reflect downward revisions to direct

(*) Between zero and +/- 50,000,000

1. Small revisions to income before 2011 result from the enhanced precision available from a new data processing system.

2. Values for imports of goods and services and for income payments (including component accounts) reflect

the values for these accounts with the sign reversed.

NOTE: Line numbers refer to ITA table 1 of the previous standard presentation, available on BEA's Web site at www.bea.gov.

investment income receipts and to other private receipts. Revisions to direct investment income receipts reflect newly available and revised data from BEA's quarterly and annual direct investment surveys. Revisions to other private receipts reflect downward revisions to dividend and average interest yields applied to U.S. holdings of foreign securities based on newly available data from the Department of the Treasury's December 2012 Annual Survey of U.S. Ownership of Foreign Securities (SHCA).

Income payments for all 3 years were revised upward. The upward revision for 2011 reflects an upward revision to direct investment income payments. The upward revisions for 2012 and 2013 reflect upward revisions to U.S. government payments and to other private payments that were partly offset by a downward revision to direct investment income payments. Revisions to direct investment income payments reflect newly available and revised data from BEA's direct investment surveys. Revisions to U.S. government payments and to other private payments reflect upward revisions to average interest yields applied to foreign holdings of U.S. securities. These revisions are primarily based on newly available information from the Department of the Treasury's June 2013 Annual Survey of Foreign Portfolio Holdings of U.S. Securities (SHLA).

Transfers. Net outflows of unilateral current transfers for 1999–2013 were revised downward reflecting the incorporation of source data from the Department of the Treasury on receipts from foreign residents for

contributions to U.S. military operations. Revisions for 2011–2013 also reflect revised source data on private remittances and other transfers, particularly data from BEA's surveys of international insurance transactions, which affect insurance-related transfers.

Revisions due to changes in classifications, definitions, and presentations

This section identifies the effects of the changes in classifications, definitions, and presentations on statistics of selected current-account transactions (table D). Except where noted, changes were implemented beginning with statistics for 1999.

Seasonally adjusted trade in goods and services by country and area. In June 2014, BEA introduced quarterly seasonally adjusted statistics on trade in goods and services for selected major trading partner countries and areas. These statistics are presented in ITA tables 2.2 (trade in goods) and 3.2 (trade in services).

Unlike the seasonal adjustments by commodity and by service type that are applied to global totals, these adjustments are developed and applied directly to the statistics at the country and world area levels. Seasonally adjusted trade data by geographic area allow data users to assess more clearly underlying patterns in geographic time series data by removing predictable seasonal patterns specific to each country or world area. For more information, see [“Seasonal Adjustment of Trade in Goods and Services by Selected Countries and World Areas: Frequently Asked Questions”](#) on the BEA Web site.

With the release of the new presentation of seasonally adjusted trade in goods for selected countries and areas in table 2.2, BEA has discontinued the seasonally adjusted statistics on trade in goods by country and area that were previously published in part B of tables 2a and 2b in the previous presentation of the ITAs. The geographic statistics in tables 2a and 2b were seasonally adjusted indirectly using seasonal factors derived through seasonal adjustment of commodity groups.

Reclassification of net exports of goods under merchanting. Net exports of goods under merchanting were reclassified from services exports under other private services exports to goods exports. They reflect the net value of goods that are purchased and subsequently sold abroad without entering the United

States. Because these goods do not cross the U.S. customs frontier, their value is not recorded in the data from the Census Bureau, the primary source for data on trade in goods. The data source for net exports of goods under merchanting is BEA's quarterly and benchmark surveys of transactions in selected services and intellectual property with foreign persons. The reclassification of merchanting transactions from services to goods is made through a new balance of payments adjustment.⁸

8. Balance of payments adjustments are adjustments that BEA applies to Census Bureau data on goods exports and imports to convert them to a balance of payments basis. These adjustments are itemized in table 2.4 in "U.S. International Transactions Tables" that accompanies this article and are incorporated into the respective general merchandise commodity categories in table 2.1.

1. U.S. contractors' expenses abroad include salaries and wages transmitted or disbursed abroad; expenses or outlays for services (including purchases from foreign subcontractors), materials, and equipment purchases abroad; and other foreign expenses (for example, local taxes and fees for permits). Under gross recording, foreign contractors' expenditures

abroad are not netted against their gross operating revenues (exports) but are recorded as imports.

NOTE: This table is a reconciliation of the current account as published in ITA table 1.2 of the new standard presentation with the current account as published in table 1 of the previous standard presentation.

Reclassifications and new definitions within services. The category “other transportation” is renamed transport and now includes passenger fares. Transport is further broken out into sea transport, air transport, and other modes of transport. Passenger fares, which covers fares for air travel, is now shown as air passenger transport, a subcomponent of air transport.

The definition of travel has been broadened to include both health-related and education-related travel and the expenditures on goods and services by border, seasonal, and other short-term workers, all of which were previously classified under other private services. The expanded definition brings the U.S. ITAs into closer alignment with international guidelines and improves the comparability of BEA’s travel statistics with those of other countries. To distinguish between the new definition and the previous definition, the category has been renamed “travel (for all purposes including education).” Along with the expanded definition of travel, BEA has introduced statistics on business travel and on personal travel. The distinction between business travel and personal travel is based on the main purpose of travel and not on the type of good or service consumed. Business travel includes (1) expenditures by border, seasonal, and other short-term workers and (2) other business travel. Personal travel covers travel for all nonbusiness purposes, including (1) health-related travel, (2) education-related travel, and (3) other personal travel. BEA uses information from the SIAT to separate what was defined as travel under the previous definition—that is, expenditures by those traveling for all purposes other than health, education, or short-term work—into spending by other business and other personal travelers.

Maintenance and repair services n.i.e. (not included elsewhere), insurance services, financial services, and telecommunications, computer, and information services have been reclassified from other private services in the previous presentation to individual major categories in the new presentation. The remainder of other private services, including research and development services, professional and management consulting services, and technical, trade-related, and other business services, is now classified as other business services.

Government goods and services n.i.e. combines transactions previously recorded in transfers under U.S. military agency sales contracts (for exports), direct defense expenditures (for imports), and U.S. government miscellaneous services (for both exports and imports), as well as expenditures of foreign governments and international organizations and foreign government workers in the United States, which were previously recorded in other private services.

Details on trade in services by type of affiliation (U.S. parents, U.S. affiliates, and unaffiliated) that were

previously published in ITA tables 3a and 7a will no longer be published on a quarterly basis. However, BEA will continue to provide the affiliation breakdown annually in the services tables presented in the international services section of the BEA Web site.

Expanded use of gross-basis recording. With this annual revision, BEA began recording the following components of other business services on a gross basis rather than on a net basis: construction services, architectural and engineering services, and mining services. Previously, BEA recorded these services on a net basis within services exports. U.S. contractors’ expenses abroad were netted against the U.S. contractors’ gross operating revenues.⁹ Under the new presentation, the contractors’ expenses abroad are represented as debits within the current account under services imports.

Beginning with statistics for 1982, direct investment income is now presented on a gross basis according to whether the income is derived from an asset or a liability. On the gross (asset/liability) basis, direct investment income receipts covers income receipts associated with U.S. assets for both outward (U.S. parents) and inward (U.S. affiliates) direct investment. Direct investment income payments covers income payments associated with U.S. liabilities for both inward (U.S. affiliates) and outward (U.S. parents) direct investment. In the previous presentation, direct investment income was shown on a directional basis. On the directional basis, direct investment income receipts (payments) covered only outward (inward) investment; income receipts associated with U.S. parents’ assets were netted against income payments associated with U.S. parents’ liabilities, and income payments associated with U.S. affiliates’ liabilities were netted against income receipts associated with U.S. affiliates’ assets.

Secondary income (current transfer) receipts and payments are now presented on a gross basis and replace the previous net measure of unilateral current transfers. The balance on secondary income presented in ITA table 1.2, line 106, of the new presentation is equivalent to net unilateral current transfers presented in ITA table 1, line 35, of the previous presentation.

Classifications of investment income by functional category and by type of income. Under primary income, investment income is classified into four functional categories—direct investment, portfolio investment, other investment, and reserve assets—and then by type of income within the functional category—(1) income on equity and investment fund

9. U.S. contractors’ expenses abroad include salaries and wages transmitted or disbursed abroad; expenses or outlays for services (including purchases from foreign subcontractors), materials, and equipment purchases abroad; and other foreign expenses (for example, local taxes and fees for permits).

shares, (2) interest income, and (3) income attributable to insurance policyholders. Income receipts on portfolio investment includes dividend and income receipts from the previous category “other private receipts.” Income payments on portfolio investment includes dividend payments from the previous category “other private payments” and interest payments from the previous categories “other private payments” and “U.S. government payments.” Income receipts and payments on other investment include interest receipts and payments and receipts and payments on income attributable to insurance policyholders from “other private” receipts and payments and “U.S. government” receipts and payments. Income on reserve assets, including interest earned on foreign-currency-denominated debt instruments and on U.S. accounts at the International Monetary Fund, which was previously commingled in government receipts, is now recorded separately.

Effects of the revisions

Goods. Goods exports for 1999–2013 were revised upward as a result of the reclassification of net exports of goods under merchanting from services exports to goods exports. The revisions averaged \$0.8 billion annually (table D).

Services. Services exports for 1999–2013 were revised upward. The revisions averaged \$3.8 billion annually. Upward revisions that averaged \$4.6 billion annually and that resulted from the addition of U.S. contractors’ expenses abroad were partly offset by downward revisions that averaged \$0.8 billion annually and that resulted from the reclassification of net exports of goods under merchanting to goods. Services imports for 1999–2013 were revised upward. The revisions averaged \$4.6 billion annually. The upward revisions resulted from recording exports of construction, architectural and engineering, and mining services on a gross basis.

Income. Primary income receipts and primary income payments for 1999–2013 were both revised upward an average of \$6.7 billion annually reflecting the recording of direct investment income on a gross (asset/liability) basis. U.S. parents’ interest payments and U.S. affiliates’ interest receipts were added to both primary income receipts and primary income payments to convert the statistics from a directional basis to a gross (asset/liability) basis.

Total revisions

This section discusses the total effects of all the changes—newly available and revised source data and changes in methodology, in source data, in classifica-

tions, in definitions, and in presentations—on the current account based on the new presentation of the ITAs (table B and table E).

Current-account statistics for 1999–2013 were revised to incorporate newly available and revised source data and changes in methodology. The current-account deficit was revised upward for 2002–2008 and for 2011–2013 and was revised downward for all other years. Because changes in classifications and definitions resulted in offsetting revisions to components of the current account, revisions to the current-account balance only reflect changes due to newly available and revised source data and changes in methodology.

The revised statistics for all years except for 2012 display the same trend in the current-account deficit as the previously published statistics. For 2012, the revised statistics indicate that the deficit increased, while the previously published statistics indicated that the current-account deficit decreased.

In addition to the sources of revisions for the annual statistics, the quarterly statistics reflect revised seasonal adjustments for exports and imports of goods and services and for receipts and payments of primary and secondary income (current transfers). The revisions to these statistics for most quarters did not affect the direction of the quarter-to-quarter changes in the current-account deficit (chart 3). The exceptions were the third quarter of 2002, the third quarter of 2003, and the first and second quarters of 2013. The revised statistics for the third quarter of 2003 and the second quarter of 2013 indicate that the deficit increased, while the previously published statistics for these quarters indicated that the deficit decreased. In contrast,

Chart 3. Quarterly Current-Account Deficit, 1999–2013

the revised statistics for the third quarter of 2002 and the first quarter of 2013 indicate that the deficit decreased, while the previously published statistics for these quarters indicated that the deficit increased.

For most quarters of 1999–2013, the revisions did not significantly affect the magnitude of the quarter-to-quarter changes in the current-account deficit. The largest revisions to the quarter-to-quarter changes were for the second quarter of 2013 when the deficit increased \$0.7 billion in the revised statistics but decreased \$8.3 billion in the previously published statistics; for the first quarter of 2012 when the increase in the deficit was revised upward \$7.5 billion; and for the fourth quarter of 2011 when the increase in the deficit was revised downward \$6.7 billion.

Goods and services. The deficit on goods and services was revised upward for 2002–2009, 2012, and 2013 and was revised downward for all other years. The revised statistics show the same trend as the previously published statistics.

The deficit on goods for all years except for 2012 was revised downward. Goods exports for all years were revised upward reflecting the reclassification of net exports of goods under merchanting from services

exports. Revisions for 2009–2013 also reflect revised source data. Goods imports were revised downward for 2011 and were revised upward for 2012 and 2013 as a result of revised source data.

The surplus on services was revised downward for 2002–2009, 2012, and 2013 and was revised upward for all other years. Services exports were revised downward for 2001–2008 and were revised upward for all other years. The downward revisions for 2001–2008 were mainly due to the incorporation of an improved estimation methodology for travel (chart 4). These revisions were partly offset by upward revisions due to both changes in classifications and the introduction of gross-basis recording of construction services, architectural and engineering services, and mining services. The upward revisions for all other years mainly reflect the incorporation of gross-basis recording.

Services imports for 2004–2013 were revised upward as a result of the introduction of gross-basis recording of construction services, architectural and engineering services, and mining services and the incorporation of an improved estimation methodology for travel. These upward revisions were partly offset by downward revisions to source data, particularly newly

(*) Between zero and +/- 50,000,000

1. The revisions also include revisions to source data.

2. Small revisions to primary income before 2011 result from the enhanced precision available from a new

data processing system.

NOTE: Line numbers refer to ITA table 1.2, available on BEA's Web site at www.bea.gov.

incorporated data from the DHS. In contrast, services imports for 1999–2003 were revised downward reflecting downward revisions due to the incorporation of the improved estimation methodology for travel and the introduction of improved traveler counts from the

DHS that were partly offset by the introduction of gross-basis recording.

Primary income. The surplus on primary income for 1999–2010 was nearly unrevised.¹⁰ The surplus on primary income for 2011–2013 was revised downward reflecting newly available and revised source data from BEA's direct investment surveys and from the Department of the Treasury surveys. Primary income receipts for 2011–2013 were revised downward, while primary income payments were revised upward. Revisions to primary income receipts and payments for 1999–2013 also reflect the introduction of gross (asset/liability) basis recording of direct investment income transactions. However, these revisions were identical for receipts and for payments and therefore did not affect the surplus on primary income.

Secondary income. The deficit on secondary income (current transfers) for 1999–2013 was revised downward reflecting the incorporation of source data from the Department of the Treasury on receipts from foreign residents for contributions to military operations. Revisions for 2011–2013 also reflect revised source data on private remittances and other transfers, particularly data from BEA's surveys of international insurance transactions.

Capital Account

Beginning with statistics for 1999, capital-account transactions are presented on a gross basis rather than on a net basis. The new components of the capital account are (1) capital transfer receipts and other credits and (2) capital transfer payments and other debits.

The balance on the capital account for 2011 and 2012 was revised slightly (table B). The deficit on the capital account for 2011 was revised downward reflecting a downward revision to capital transfer payments and other debits. The surplus on the capital account for 2012 was revised downward reflecting an upward revision to capital transfer payments and other debits. These revisions resulted from new information on transactions between sports franchises for the rights to negotiate with professional athletes.

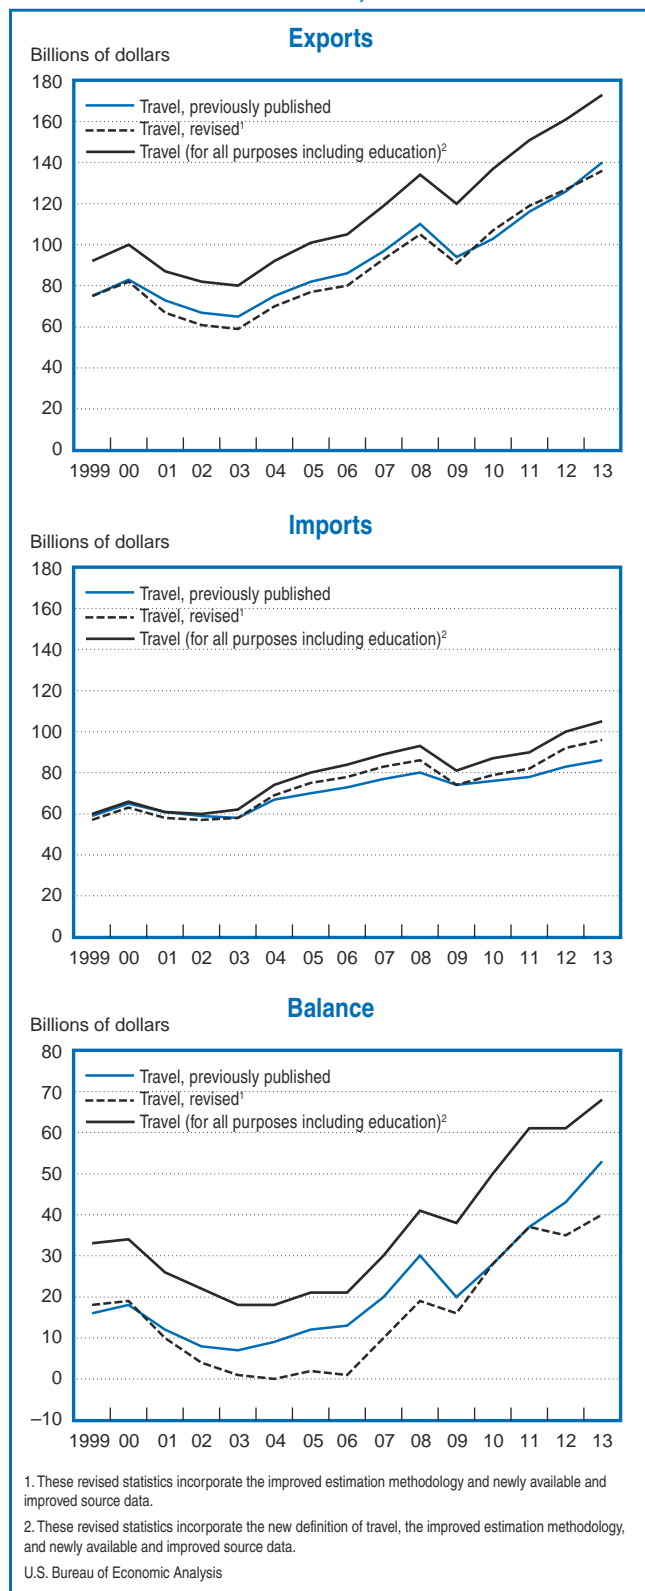

Financial Account

Revisions due to newly available and revised source data

Financial-account statistics for 2009–2013 were revised as a result of newly available and revised source data (table F). Net financial inflows, which include transactions in financial derivatives, were revised downward \$0.1 billion for 2009, \$1.1 billion for 2010,

10. Small revisions to primary income before 2011 (appendix A) resulted from the enhanced precision available from a new data processing system.

Chart 4. Revisions to Travel, 1999–2013

\$36.0 billion for 2011, and \$15.9 billion for 2012 and were revised upward \$19.4 billion for 2013. Revisions to net financial flows represent the combined revisions to transactions in U.S.-owned assets abroad, foreign-

owned assets in the United States, and financial derivatives, net. These revisions reflect the incorporation of newly available and revised source data from BEA's quarterly and annual surveys of direct investment and

1. Values for acquisition or sales of U.S.-owned assets abroad (including component accounts) and of net financial flows reflect the values for these accounts with the sign reversed.

2. Small revisions to these accounts for 2010 and 2011 result from the enhanced precision available from a

new data processing system.

NOTE: Line numbers refer to ITA table 1 of the previous standard presentation, available on BEA's Web site at www.bea.gov.

from three surveys administered by the Department of the Treasury: (1) Aggregate Holdings of Long-Term Securities by U.S. and Foreign Residents (SLT) survey, (2) the December 2012 Annual Survey of U.S. Ownership of Foreign Securities (SHCA), and (3) the June 2013 Annual Survey of Foreign Portfolio Holdings of U.S. Securities (SHLA).

The volatility in quarterly net financial transactions reflects the volatility in global financial markets as well as the incomplete measurement of financial-account transactions. These transactions can respond very quickly to changing conditions in financial markets, resulting in large quarterly increases or decreases in financial-account components. Quarterly changes can range from a few million dollars to hundreds of billions of dollars and can change from an increase to a decrease from one quarter to the next. Volatility in net financial transactions is also due to incomplete or imperfect measurement that may cause mismatches between components of transactions that would otherwise be offsetting if the measurement were more complete or more accurate. Net annual financial transactions are less susceptible to such measurement-driven volatility.

U.S.-owned assets abroad

Transactions in U.S.-owned assets abroad, excluding financial derivatives represent the net acquisition or sale of foreign financial assets by U.S. residents in which increases (acquisitions) are recorded as outflows. Upward revisions of \$22.7 billion for 2011, of \$31.4 billion for 2012, and of \$33.1 billion for 2013 reflect very different annual patterns in the revisions to the underlying component accounts of U.S. direct investment abroad, foreign securities, nonbank claims, and bank claims.

U.S. direct investment abroad. Revisions resulted from the incorporation of newly available and revised source data from BEA's quarterly and annual surveys of direct investment. An upward revision of \$10.1 billion for 2011 reflects an upward revision to equity investment that was partly offset by downward revisions to both reinvested earnings and intercompany debt investment. A downward revision of \$55.3 billion for 2012 reflects downward revisions to all three components: reinvested earnings, intercompany debt investment, and equity investment. A downward revision of \$10.1 billion for 2013 reflects a downward revision to reinvested earnings that was partly offset by upward revisions to both intercompany debt investment and equity investment.

Foreign securities. Revisions to U.S. net purchases of foreign securities reflect revised SLT data, the incorporation of the SHCA data as of December 2012, and

revised transactions for stock swaps. Revisions to financial transactions for foreign stocks and bonds resulted in a slight upward revision to foreign securities for 2011. The incorporation of SHCA and SLT data led to improved statistics for transactions (net purchases or net sales), price changes, and other changes in volume and valuation for 2012 and 2013. As a result, net purchases of foreign securities were revised upward \$103.0 billion for 2012 and \$56.3 billion for 2013.

U.S. net purchases of foreign bonds were revised upward \$82.3 billion for 2012 and \$7.3 billion for 2013 as a result of including previously unreported U.S. net purchases. The upward revision for 2012 reflects the incorporation of revised SHCA data that revealed holdings were much higher than previously reported, largely because of larger net purchases. The upward revision for 2013 reflects revised SLT data that revealed more price depreciation of foreign securities and larger net purchases. U.S. net purchases of foreign stocks were revised upward \$20.7 billion for 2012 and \$49.1 billion for 2013. The upward revision for 2012 reflects revised SHCA data that revealed significantly less price appreciation and larger net purchases than previously reported. The upward revision for 2013 reflects revised SLT data that revealed larger net purchases.

Nonbank claims. Revisions to transactions in nonbank claims were relatively small. Decreases in nonbank claims were revised upward \$2.2 billion for 2011, increases in nonbank claims were revised upward \$5.4 billion for 2012, and increases in nonbank claims were revised downward \$5.2 billion for 2013. These revisions reflect revised data from the Treasury International Capital (TIC) reporting system as well as other sources and revised data on the intercompany debt claims of financial intermediaries from BEA's surveys of direct investment.

Bank claims. Decreases in bank claims were revised downward \$13.9 billion for 2011 and were revised upward \$21.7 billion for 2012 and \$7.0 billion for 2013. These revisions were largely due to revised data from the TIC reporting system. The revisions also partly reflect revised data from BEA's direct investment surveys.

Foreign-owned assets in the United States

Transactions in foreign-owned assets in the United States, excluding financial derivatives represent the net acquisition or sales of U.S. financial assets by foreign residents in which increases (acquisitions by foreign residents) are recorded as inflows. The largest revision was for 2013: the increase in U.S. liabilities was revised upward \$52.9 billion.

Foreign direct investment in the United States. Revisions resulted from the incorporation of newly

available and revised source data from BEA's quarterly and annual surveys of direct investment. An upward revision of \$5.8 billion for 2011 reflects upward revisions to equity investment and to intercompany debt investment that were partly offset by a downward revision to reinvested earnings. An upward revision of \$8.8 billion for 2012 reflects an upward revision to equity investment that was largely offset by downward revisions to intercompany debt investment and to reinvested earnings. An upward revision of \$42.9 billion for 2013 reflects upward revisions to equity investment and to intercompany debt investment that were partly offset by a downward revision to reinvested earnings.

Official and private transactions in U.S. Treasury securities. Foreign official net purchases of U.S. Treasury securities were revised upward \$0.6 billion for 2012 and \$2.5 billion for 2013. Private net purchases of U.S. Treasury securities were revised downward \$2.6 billion for 2011, \$0.4 billion for 2012, and \$9.0 billion for 2013. These revisions were largely due to revised data from the monthly SLT survey that revealed that changes in foreign official and private holdings of long-term U.S. Treasury securities were \$0.2 billion higher for 2012 and \$6.6 billion lower for 2013 than previously reported. As a result, financial transactions for 2012 were revised slightly upward, and financial transactions for 2013 were revised downward.

Official transactions in other U.S. government securities. Foreign official net sales of other U.S. government-sponsored agency securities, such as those issued by Fannie Mae and Freddie Mac, were nearly unrevised for 2012 and 2013 after the incorporation of revised data from the monthly SLT survey. The revised SLT data revealed that changes in foreign official holdings of agency securities were nearly the same as previously reported.

Other foreign official assets. Foreign official net purchases of other foreign official assets (U.S. corporate stocks and bonds) were revised downward \$9.9 billion for 2011 and were revised upward \$1.9 billion for 2012 and \$0.4 billion for 2013 as a result of the incorporation of revised source data from the SLT survey. The revised SLT data revealed that changes in holdings of other foreign official assets were lower than previously reported for 2011 and were higher than previously reported for 2012 and 2013; the incorporation of these data resulted in a downward revision to transactions for 2011 and in upward revisions to transactions for 2012 and 2013.

Private transactions in U.S. securities other than U.S. Treasury securities. Private foreign net sales of U.S. securities other than U.S. Treasury securities (U.S. agency securities and U.S. corporate stocks and bonds) were nearly unrevised for 2011. Private foreign net

purchases were revised upward \$0.1 billion for 2012 and \$13.8 billion for 2013. These revisions resulted from revised SLT data and the incorporation of data from the SHLA survey.

Nonbank liabilities. Increases in nonbank liabilities were revised downward \$4.2 billion for 2011, and decreases in nonbank liabilities were revised downward \$3.4 billion for 2012 and \$2.1 billion for 2013. These revisions resulted from the incorporation of revised data from the TIC reporting system and from BEA's quarterly and annual surveys of direct investment.

Bank liabilities. Increases in bank liabilities were revised downward \$1.8 billion for 2011, decreases in bank liabilities were revised downward \$0.6 billion for 2012, and increases in bank liabilities were revised upward \$0.8 billion for 2013. These revisions resulted from the incorporation of revised data from BEA's quarterly and annual surveys of direct investment and from the TIC reporting system.

Revisions due to changes in classifications, definitions, and presentations

This section identifies the effects of the changes in classifications, definitions, and presentations on statistics of selected financial-account transactions (table G). Except where noted, changes were implemented beginning with statistics for 1999.

The financial account is significantly restructured in the new standard presentation of the ITAs. Net U.S. acquisition of financial assets excluding financial derivatives replaces U.S.-owned assets abroad, excluding financial derivatives, and net U.S. incurrence of liabilities excluding financial derivatives replaces foreign-owned assets in the United States, excluding financial derivatives. Net lending or net borrowing is calculated as the difference between the net acquisition of financial assets excluding financial derivatives and the net incurrence of liabilities excluding financial derivatives plus net transactions in financial derivatives. In the new presentation, net lending or net borrowing from financial-account transactions takes the opposite sign of net financial flows in the previous presentation. Net lending will be positive whenever the net acquisition of financial assets exceeds the net incurrence of liabilities, a situation that previously resulted in negative net financial flows.

Classifications by major functional category and by instrument. Financial-account transactions are classified into five functional categories—direct investment, portfolio investment, other investment, reserve assets, and financial derivatives—and then by type of instrument within the functional category (for example, equity, debt securities, and loans). Instrument detail is provided under the functional categories in ITA

table 1.2 of the new presentation. Tables for portfolio investment and other investment provide statistics by sector. This consistent structure replaces the previous

financial-account structure, which was a mix of classifications by U.S. sector, by sector of the foreign counterparty, by reporter, and by instrument. The changes

Table G. Financial-Account Changes in Classifications and Definitions

(*) Between zero and +/- 50,000,000

1. Values for acquisition or sales of U.S.-owned assets abroad from previous table 1 (including component accounts) reflect the values for these accounts with the sign reversed.

2. Financial transactions on an asset/liability basis are organized according to whether the transactions relate to an asset or a liability. Net U.S. acquisition of direct investment assets relates to U.S. parent and U.S. affiliate acquisition of claims (assets). Net U.S. incurrence of direct investment liabilities relates to U.S. affiliate and U.S. parent incurrence of liabilities.

3. Purchases of foreign stocks are published separately in previous table 8a, line A4. Purchases of foreign bonds are published separately in table 8a, line A18.

4. Commercial paper bank claims are published separately in previous table 10a, line 23. Negotiable certificates of deposit (NCDs) bank claims and other short-term instrument bank claims are included in previous table 10a but not all details are available separately.

5. Nonbank NCDs are published in previous table 9a, line A6. Nonbank other short-term instruments are published in table 9a, line A7.

6. Formerly foreign currencies, table 1, line 46. Instrument detail was not previously available separately.

7. Foreign official purchases of U.S. stocks are published separately in previous table 8a, memorandum line 4. Foreign official purchases of U.S. bonds are published separately in table 8a, memorandum line 3.

8. Private purchases of U.S. stocks are published separately in previous table 8a, line B4. Private purchases of U.S. corporate bonds are published separately in table 8a, line B16, and private purchases of U.S. agency bonds are published separately in table 8a, line B30.

9. Nonbank short-term instruments are published in previous table 9a, line B6.

10. NCD bank liabilities and other short-term instrument bank liabilities are included in previous tables 5 and 11a but not all details are available separately.

11. Values for financial derivatives, net, from previous table 1 (including component accounts) reflect the values for these accounts with the sign reversed.

Note. This table is a reconciliation of the financial-account transactions as published in ITA table 1.2 of the new standard presentation with the financial-account transactions as published in tables 1, 5, 8a, 9a, 10a, and 11a of the previous standard presentation.

in classifications and definitions are presented in table G, grouped by the new functional categories:

- Direct investment is presented on the gross (asset/liability) basis.
- Portfolio investment is presented by combining transactions in short-term securities and negotiable certificates of deposit (NCDs) with transactions in long-term securities.
- Other investment is presented by removing transactions in short-term securities and NCDs from accounts that had previously combined these transactions with transactions in deposits, loans, and trade credit and advances, all of which are major components of other investment.
- Reserve assets are not redefined but are presented in greater detail.
- Financial derivatives other than reserves, net transactions are presented with signs that are opposite those used in the previous standard presentation.

In table G, the functional categories are presented along with the related components of the previous standard presentation that comprise the new functional categories. Financial transactions are presented with signs that reflect the new presentation; increases are represented by positive values and decreases are represented by negative values. Direct investment, portfolio investment, and other investment are the sum of the components from the previous presentation plus adjustments. Adjustments made to the previous line items to derive the new functional categories are presented with signs that depend on whether transactions are being added or removed.

Direct investment presented on a gross (asset/liability) basis. Beginning with statistics for 1982, direct investment financial transactions are now presented on a gross (asset/liability) basis according to whether the transactions are related to assets or liabilities rather than on a directional basis.

On the gross (asset/liability) basis, the financial-account category “net U.S. acquisition of financial assets” includes only transactions related to assets. Consequently, this account includes transactions related to U.S. parent companies’ investments in their foreign affiliates, but not those related to the foreign affiliates’ investments in their U.S. parents, which are now included in incurrence of liabilities. Similarly, net U.S. incurrence of liabilities includes transactions related to foreign residents’ direct investments in their U.S. affiliates, but not those related to U.S. affiliates’ investments in their foreign parents, which are now included in acquisition of assets. Although this change increases the level of transactions for direct investment assets and liabilities, it does not affect the net value of these two

levels or net lending or net borrowing from financial-account transactions.

The change in presentation of direct investment to a gross (asset/liability) basis resulted in identical upward revisions to transactions in direct investment assets and in direct investment liabilities of \$21.3 billion for 2011, of \$42.5 billion for 2012, and of \$58.7 billion for 2013.

Portfolio investment. In the restructured accounts, portfolio investment assets and liabilities are presented in ITA table 1.2 with their major components: (1) equity and investment fund shares and (2) debt securities. Table G shows the components of each of these lines, including, for assets, foreign stocks and bonds from ITA table 1, line 52, of the previous presentation, and the adjustment to add transactions in foreign short-term securities and NCDs. In the previous presentation, net purchases of foreign stocks and bonds by U.S. residents were presented in ITA table 1, line 52, and foreign stocks and bonds were presented separately in ITA table 8a. Also in the previous presentation, transactions in short-term securities and NCDs were commingled with loans, deposits, and trade credit and advances in ITA table 1, lines 53 and 54. Some components of short-term securities and NCDs were presented separately in ITA tables 9a and 10a, but other components were commingled with deposits and loans.

Compared with transactions in the previous category “foreign securities,” net U.S. purchases in the new category “portfolio investment”—which includes transactions in short-term securities and NCDs—are smaller by \$59.3 billion for 2011 and by \$8.1 billion for 2012 and are larger by \$44.7 billion for 2013.

Transactions in portfolio investment liabilities are comprised of several components from the previous presentation, representing transactions of foreign official agencies and other foreign residents in U.S. corporate stocks, U.S. Treasury securities, U.S. agency bonds, U.S. corporate bonds, and the adjustment to add transactions in U.S. short-term debt securities and NCDs. In the previous presentation, transactions in U.S. short-term securities and NCDs were commingled with deposits, loans, and trade credit and advances in ITA table 1, lines 61, 68, and 69. Some components of short-term securities and NCDs were presented separately in ITA tables 5, 9a, and 11a, but other components were commingled with deposits and loans.

Compared with transactions for securities in previous ITA table 1, lines 58, 59, 62, 65 and 66, net foreign purchases in the new category “portfolio investment”—which includes transactions in short-

term securities and NCDs—are smaller by \$26.3 billion for 2011 and are larger by \$4.2 billion for 2012 and by \$25.2 billion for 2013.

Other investment. Other investment is comprised of currency, deposits, loans, insurance technical reserves, trade credit and advances, and allocations of special drawing rights (liabilities only). In the previous presentation, insurance technical reserves were not separately available and in the restructured accounts, separate statistics for insurance technical reserves are not yet available. Therefore, separate line items for insurance technical reserves are not included in table G.

Other investment assets includes lines 46, 53, and 54 of ITA table 1 from the previous presentation excluding transactions in foreign short-term securities and NCDs, which are commingled with deposits, loans, and trade credit and advances in lines 53 and 54. This exclusion removes amounts for short-term securities and NCDs that were added to portfolio assets, resulting in larger estimates of transactions in other investment assets than for the previous aggregate of these line items for 2011 and 2012 and in a smaller estimate for 2013.

Other investment liabilities includes transactions of foreign official agencies and other foreign residents with U.S. government agencies, U.S. banks and securities brokers and their customers, and other U.S. non-banking concerns (presented in lines 60, 61, 67, 68, and 69 of ITA table 1 of the previous presentation), plus the adjustment to remove transactions in U.S. short-term securities and NCDs, which are commingled with deposits, loans, and trade credit and advances in lines 61, 68, and 69. This exclusion removes amounts for short-term securities and NCDs that were added to portfolio liabilities, resulting in a larger estimates for other investment liabilities than for the previous aggregate of these line items for 2011 and in smaller estimates for 2012 and 2013.

The restructuring of the financial account related to portfolio investment and to other investment did not result in revisions to net transactions in U.S. assets or in U.S. liabilities because the addition of transactions in short-term securities and NCDs to portfolio transactions is entirely offset by the removal of these transactions from other investment.

Reserve assets. Reserve assets are presented with expanded detail in the new presentation. The foreign currencies component from the previous presentation is renamed other reserve assets. Other reserve assets are presented with instrument detail for currency and deposits, securities, financial derivatives, and other claims. This change in presentation did not result in revisions to financial transactions in reserve assets.

Financial derivatives other than reserves, net transactions. Financial derivatives, net in the previous presentation is renamed financial derivatives other than reserves, net transactions in the new presentation to indicate that the financial derivatives functional category excludes financial derivatives in reserve assets. The U.S. monetary authorities do not currently hold financial derivatives as reserve assets, so all transactions and positions in financial derivatives reported in the TIC reporting system continue to be included in financial derivatives other than reserves, net transactions.

The sign used for net transactions in financial derivatives other than reserves is opposite that used for the data reported in the TIC system and for the statistics in the previous presentation of the ITAs. In the new presentation, measures that subtract transactions in liabilities from transactions in assets, such as financial derivatives other than reserves, net transactions, have a positive sign for net financial outflows, representing net U.S. lending to foreign residents, and a negative sign for net financial inflows, representing net U.S. borrowing from foreign residents.

Aside from the change in sign, no revisions to net financial transactions in financial derivatives resulted from the changes in presentations.

Total revisions

This section presents the total effects of newly available and revised source data as well as of changes in classifications, definitions, and presentations on the financial account based on the new presentation of the ITAs (table H).

Financial-account statistics for 1982–2013 were revised. Net lending or net borrowing from financial-account transactions for 1982–2008 was nearly unrevised.¹¹ Net borrowing was revised downward for 2009–2012 and was revised upward for 2013. The revised statistics for all years show the same trend in net lending or net borrowing as the previously published statistics. Because the change in presentation for direct investment statistics did not affect net transactions, the revisions to net lending or net borrowing only reflect changes due to newly available and revised source data.

In addition to the sources of revision for the annual statistics, the quarterly statistics reflect revised seasonal adjustments. The revisions to quarterly statistics for 2009–2013 generally did not affect the direction of the quarter-to-quarter changes in net lending or net borrowing from financial-account transactions (chart 5).

11. Small revisions to net lending or borrowing before the fourth quarter of 2009 (appendix A) resulted from the enhanced precision available from a new data processing system.

The exceptions were for the third quarter of 2012 and for the third quarter of 2013. In the third quarter of 2012, the revised statistics indicate that transactions shifted to net lending, while the previously published

Chart 5. Net Lending or Net Borrowing From Financial-Account Transactions, 2008–2013

statistics indicated that net borrowing increased. In the third quarter of 2013, the revised statistics indicate that net borrowing decreased, while the previously published statistics indicated that net borrowing increased slightly. For most quarters between 2009–2013, the revisions did not significantly affect the magnitude of the quarter-to-quarter changes in net borrowing. Notable revisions to the quarter-to-quarter changes were for the second, third, and fourth quarters of 2012 and the fourth quarter of 2013. In the second quarter of 2012, net borrowing decreased \$215.0 billion in the revised statistics, while it decreased \$245.5 billion in the previously published statistics. In the third quarter of 2012, transactions shifted \$36.1 billion from net borrowing to net lending in the revised statistics, but net borrowing decreased \$10.8 billion in the previously published statistics. In the fourth quarter of 2012, transactions shifted \$137.9 billion from net lending to net borrowing in the revised statistics, but net borrowing increased \$101.0 billion in the previously published statistics. In the fourth quarter of 2013, net borrowing increased \$68.3 billion in the revised statistics, while it increased \$105.5 billion in the previously published statistics.

¹. Small revisions to these accounts before 2009 result from the enhanced precision available from a new data processing system.

NOTE. Line numbers refer to ITA table 1.2 of the new standard presentation, available on BEA's Web site at www.bea.gov.

Statistical Discrepancy

The statistical discrepancy is defined as the difference between total debits and total credits recorded in the current, capital, and financial accounts. In principle, the combined deficit (or surplus) on recorded transactions in the current and capital accounts should equal net borrowing (or net lending) measured by recorded transactions in the financial account. In practice, however, they differ because of incomplete source data, gaps in coverage, timing differences, or other errors and omissions.

Table B presents revisions to the statistical discrepancy for 1999–2013. The revisions for 1999–2008 reflect revisions to the deficit on the current account only. For these years, the average absolute revision to the deficit on the current account is approximately \$4.4 billion. The revisions for 2009–2013 mostly reflect

revisions to net borrowing from financial-account transactions and to the deficit on the current account. The largest revisions to the statistical discrepancy are for 2011 and 2012. For 2011, the statistical discrepancy was revised from –\$92.8 billion to –\$55.2 billion, mostly as a result of a downward revision to net borrowing from financial-account transactions. For 2012, the statistical discrepancy was revised from –\$5.9 billion to \$30.4 billion as a result of both an upward revision to the deficit on the current account and a downward revision to net borrowing from financial-account transactions. For 2013, the statistical discrepancy was revised upward \$1.6 billion reflecting an upward revision to the deficit on the current account that was mostly offset by an upward revision to net borrowing from financial-account transactions.

(*) Between zero and +/- 500,000

n.a. Not available

1. Small revisions to the balance on primary income before the first quarter of 2011 and to net lending or borrowing before the fourth quarter of 2009 result from the enhanced precision available from a new data

processing system.

2. Previously published values for net lending or borrowing reflect the previously published values for net financial flows with the sign reversed.

NOTE: Details may not add to totals because of rounding.
